ALA and ALA4R

January 2017

Ben Raymond alaben@untan.gl

Dave Martin david.martin@csiro.au

ALA — *sharing biodiversity knowledge*

>\$50 million investment

- \$8.2M NCRIS (2007-2011)
- \$30M SS EIF (2010-2012)
- \$2.8 M CRIS (2013-2015)
- \$5.7M NCRIS2013 (2013-2015)
- \$4.6M NCRIS 2015

NCRIS
National Research
Infrastructure for Australia
An Australian Government Initiative

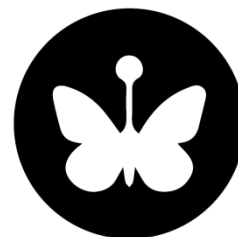

A world-leading
collaborative e-infrastructure
integral to growing
biodiversity knowledge

Partners — founding & beyond

- founding partners and contributors
primarily biological collections and
museums
- increased contribution & use by
citizen science, government, industry

>57 million records
>1100 data sets
>410 spatial layers
>3.7 billion records downloaded
>3.5 thousand users/day

National Research infrastructure

- NCRIS established in 2006
- Currently within Education Dept
- Related environmental infrastructures TERN
(terrestrial ecological info/data capture) & IMOS
(marine)

Data

- specimens
- occurrence
- images, sounds
- literature
- sequences
- more coming.....

Open source & open access

- ALA driving cultural shift regarding open access to data
- ALA at forefront of accessibility to public sector information

System

- data capture & aggregation
- data management
- data discovery
- data visualisation
- data analysis & reporting

Production installations

- Spain
- France
- ICMBio Brazil
- Costa Rica
- UK (Scotland)
- Argentina
- Portugal
- Sweden
- Australia

Front End Apps

ALA Service Layer (logical) - XML/JSON/WMS services

Web services

SOLR

SOLR

DBs, Indexes, Filesystem storage

cassandra

MySQL

Postgres

PostGIS

Filesystem
(GeoTIFF, shapefiles, DIVA grids)

MySQL

PostGIS

Mongo

Offline processing

Occurrence processing

Processing

- motivation:
 - easy R access to ALA data and resources
 - support data-driven biodiversity science
 - also use compute-at-node where sensible
- subset of the full ALA API (<http://api.ala.org.au/>)
- first ALA4R release (github) 2014, CRAN release 2016
- reconfigurable: use with other national installations using ALA infrastructure

- core functionality
 - name searching
 - names lookup, partial matching, fulltext searching
 - species information
 - taxonomy, species profiles, images
 - occurrences
 - with environmental/contextual data
 - "offline" mode for large downloads
 - species lists
 - species by site matrices
 - environmental
 - environmental/contextual data

ALA4R examples

- some examples: see R script
- also
`vignette("ALA4R")`

Other examples: soundscape

- Ebbe Nielsen challenge round 1 winner, 2015
- <https://peterneish.github.io/gbif-soundscape/>
- overview:
 - get species list in region of interest
 - download sound recordings and images of those species
 - play back to produce a soundscape of the region
- [R source](#)

Other examples: Eucalypt height

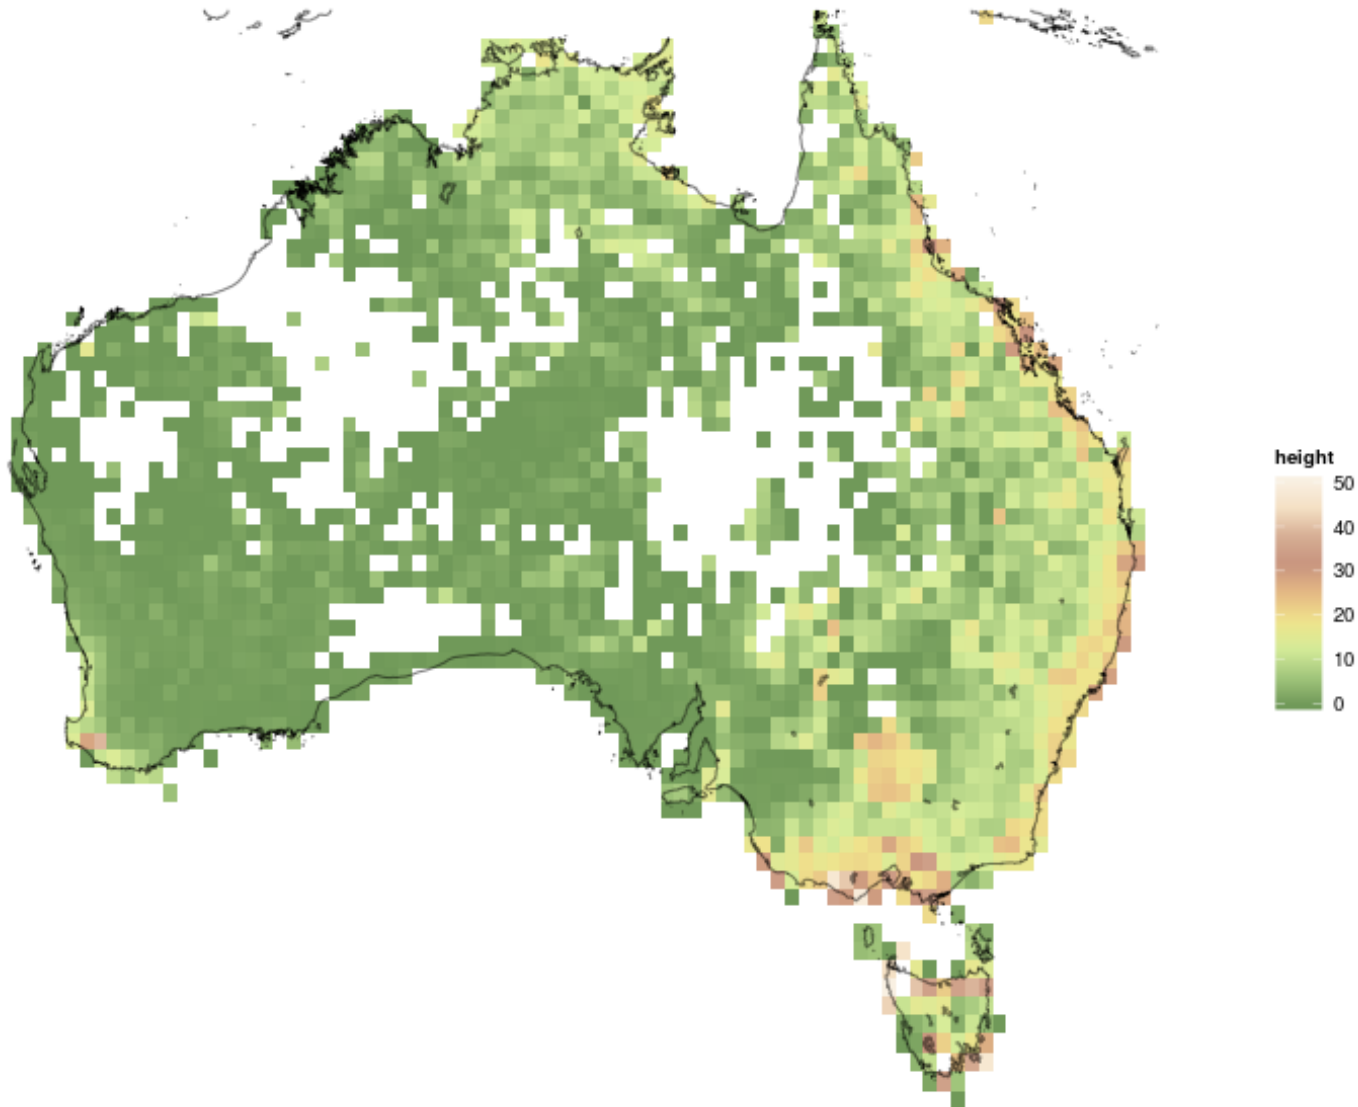

- [More info](#) and [R source](#)
- ALA4R::species_info returns an information profile that includes descriptive text
- for plants, e.g.
 - "tree up to 90 metres"
 - "grows to 15 metres"
 - "may reach 30 - 40 metres in height"
 - "growing to a maximum height of 4 metres"
- can we use this as a source of trait (height) information?

Other examples: Eucalypt height

- download gridded eucalypt data:

```
ss <- sites_by_species("genus:Eucalyptus", ...)
```
- for each species, run the `species_info` function and extract height information
- given heights of species, and species within grid cells, map height across grid cells

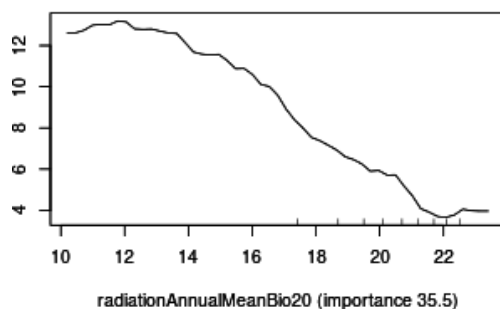

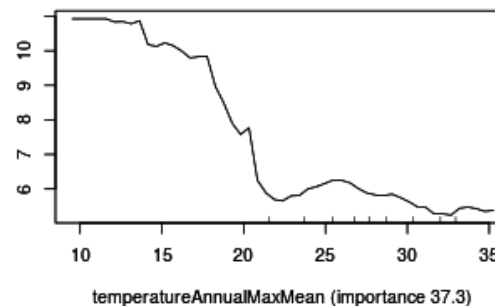

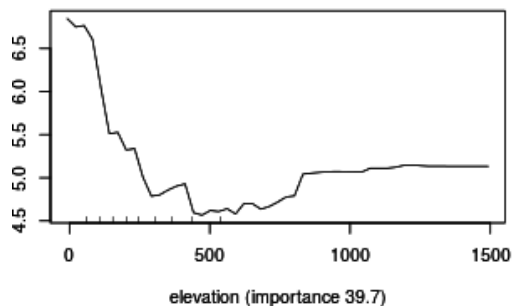

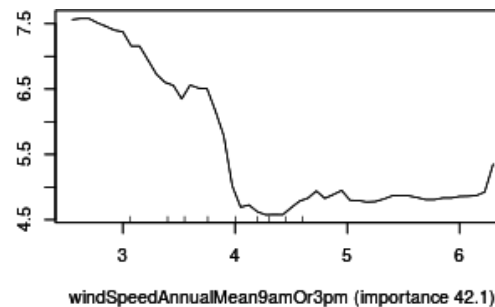

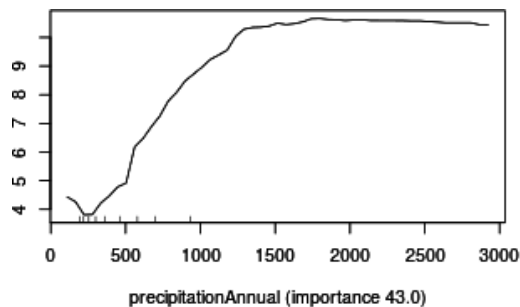

Other examples: Eucalypt height

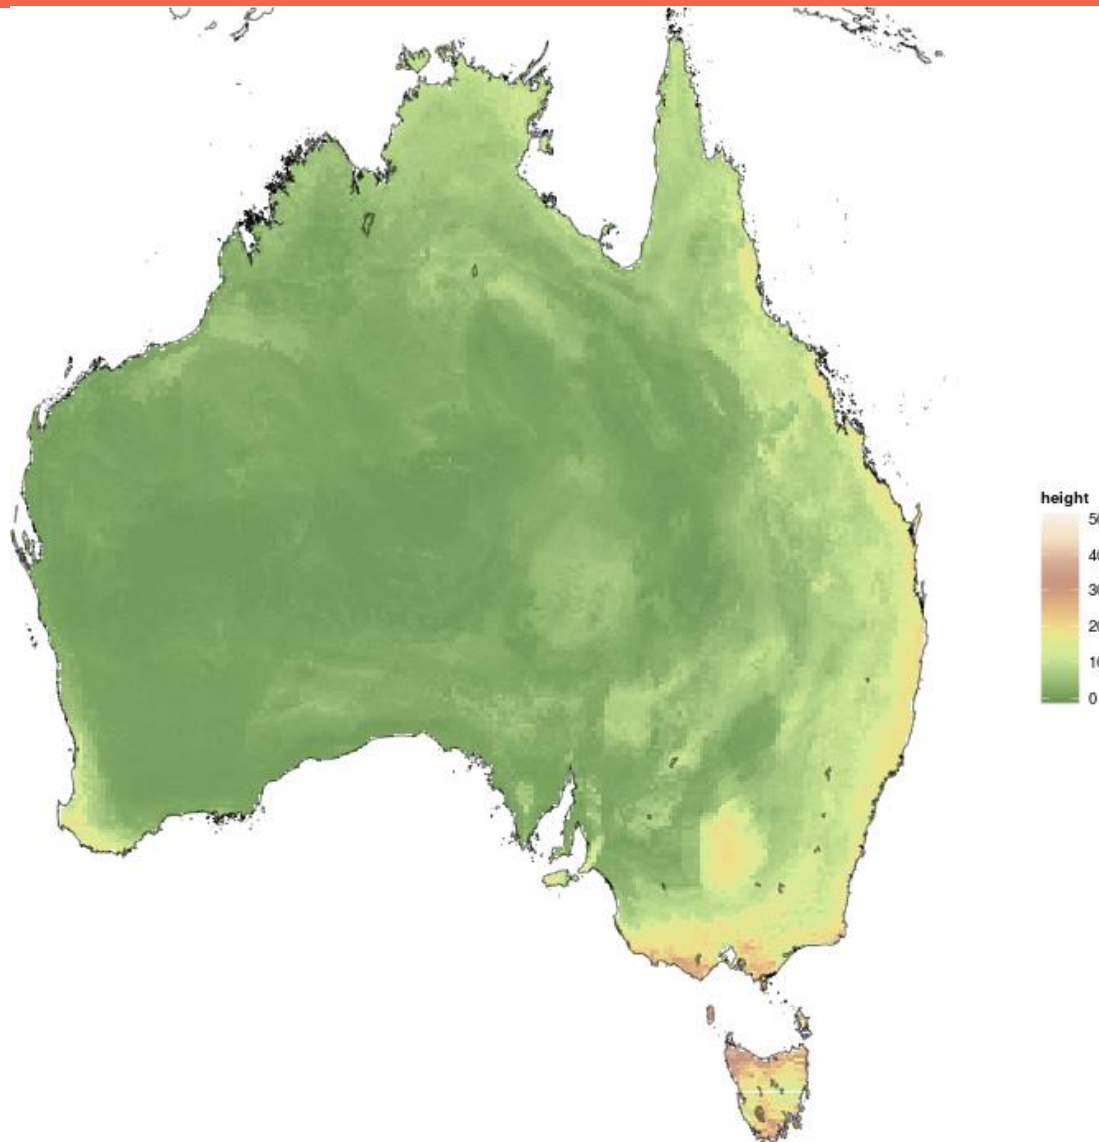

Other examples: Eucalypt height

- using a random forest, model height as function of environmental variables
 - precipitation
 - solar radiation
 - elevation
 - maximum temperature
 - wind speed

Other examples: Eucalypt height

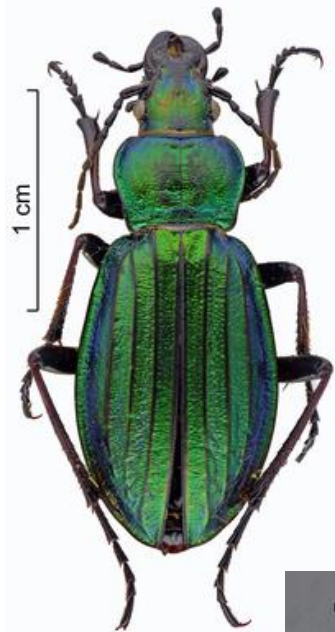

Other examples: Eucalypt height

Colours from images

- [More info](#) including R source
- many sources of species photographs
- can we extract colour information from photos?
 - evolution of colour traits
 - colour variation with taxonomy
 - link with occurrence records to reconstruct spatial variations in colour
 - environmental drivers of colour variation

Typical beetle images

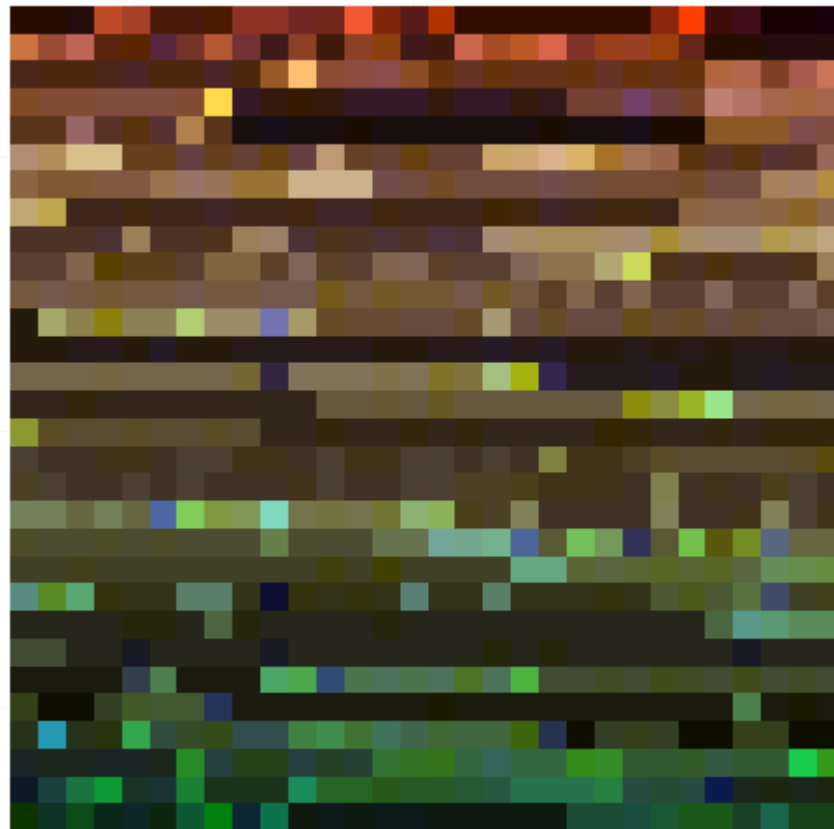

Colours from images: processing

- list of species in the family Carabidae (ground beetles)
- find up to 10 images per species
 - look for `PRESERVED_SPECIMEN` as the `basisOfRecord` attribute
- manual filtering of unsuitable images
 - for simplicity, use only images with near-white backgrounds
 - discard near-white colours

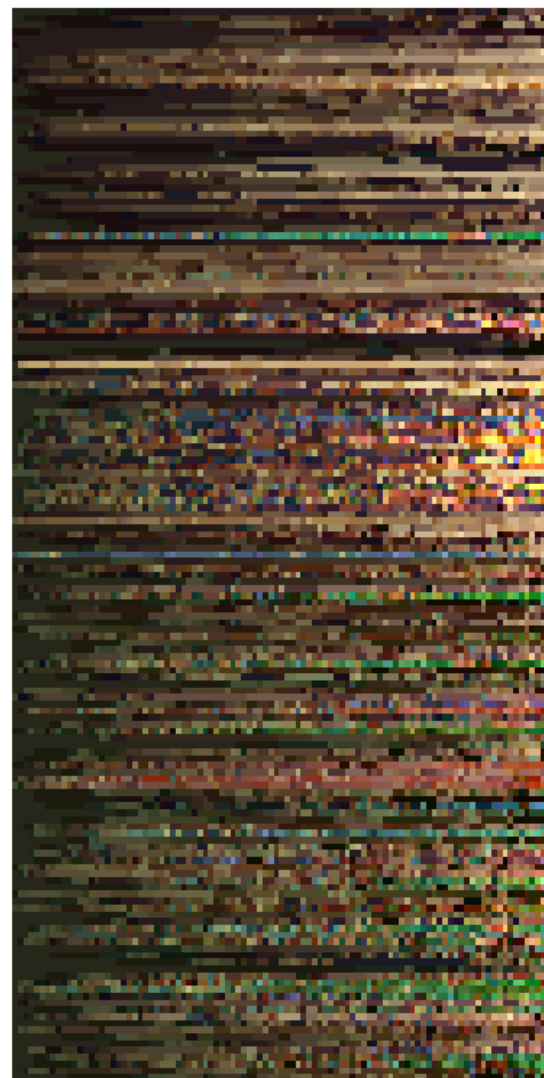

Colours from images: palette

- build a global colour palette (i.e. a matrix of all of the colours present in all images)

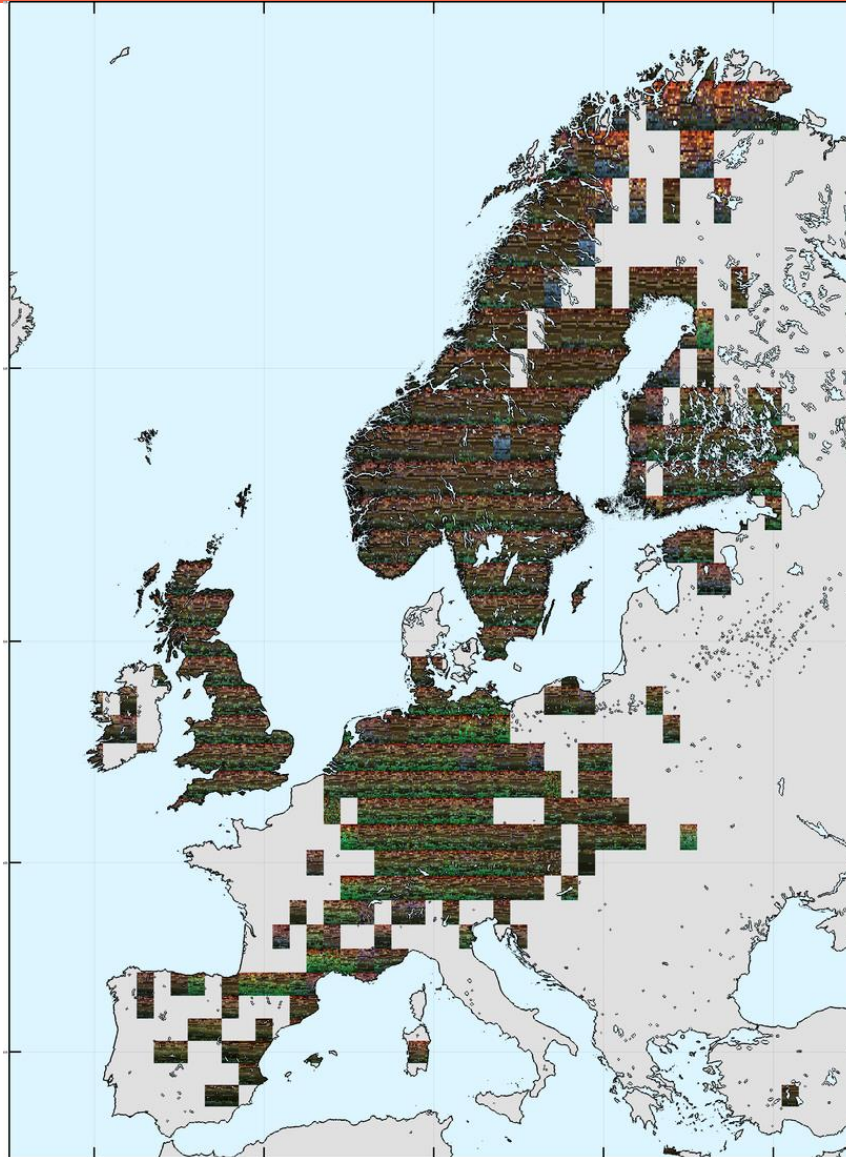

ATLAS OF **LIVING**
AUSTRALIA

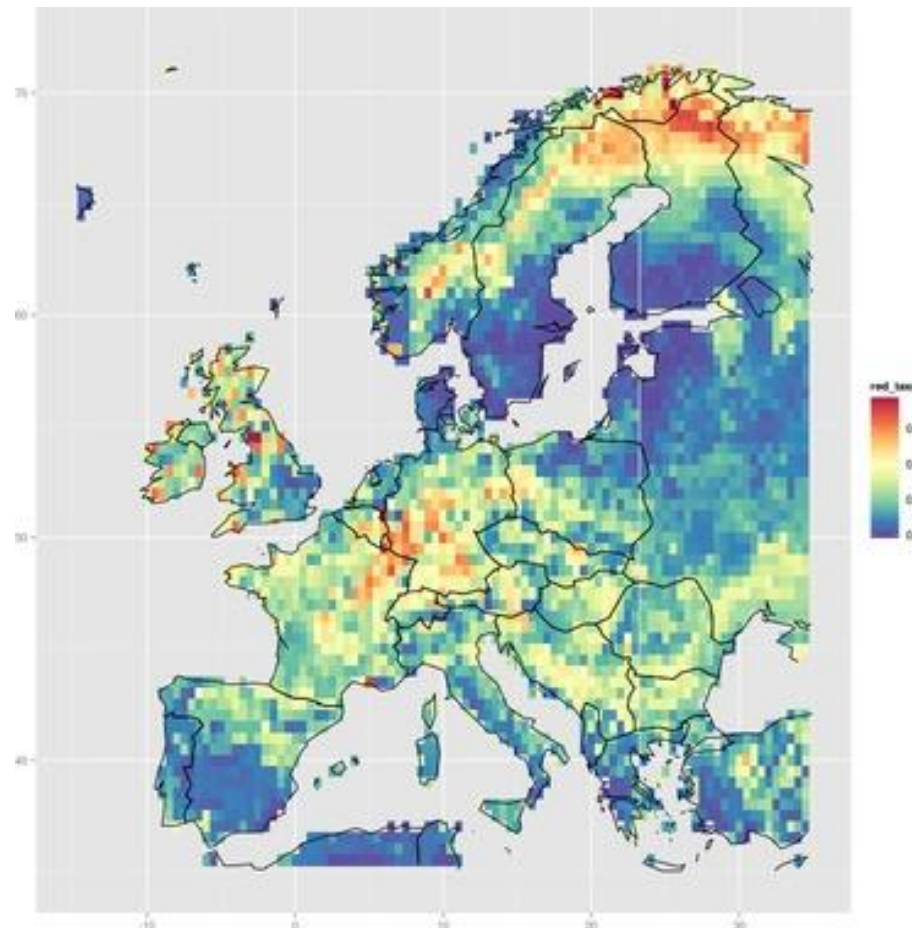

Colours across space

Colours as function of environment

- probability of red colouration

Other image sources

- colours of Grevillea flowers
- images from ALA/other species information pages
- typically photos of live plants, not specimens

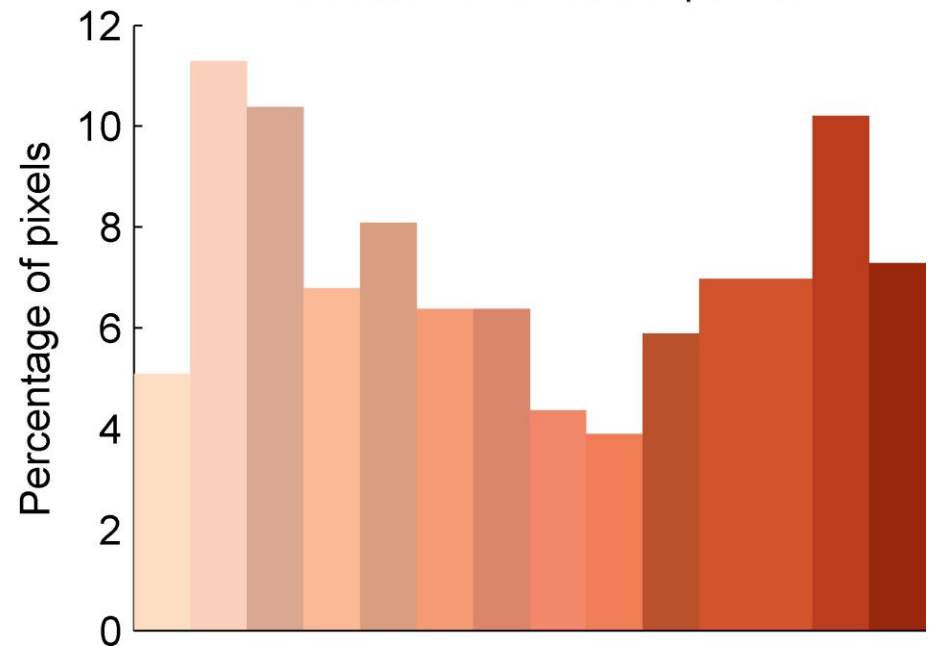

Processing

- for each photo, extract representative flower colour palette

Grevillea aneura

Extracted flower colour palette

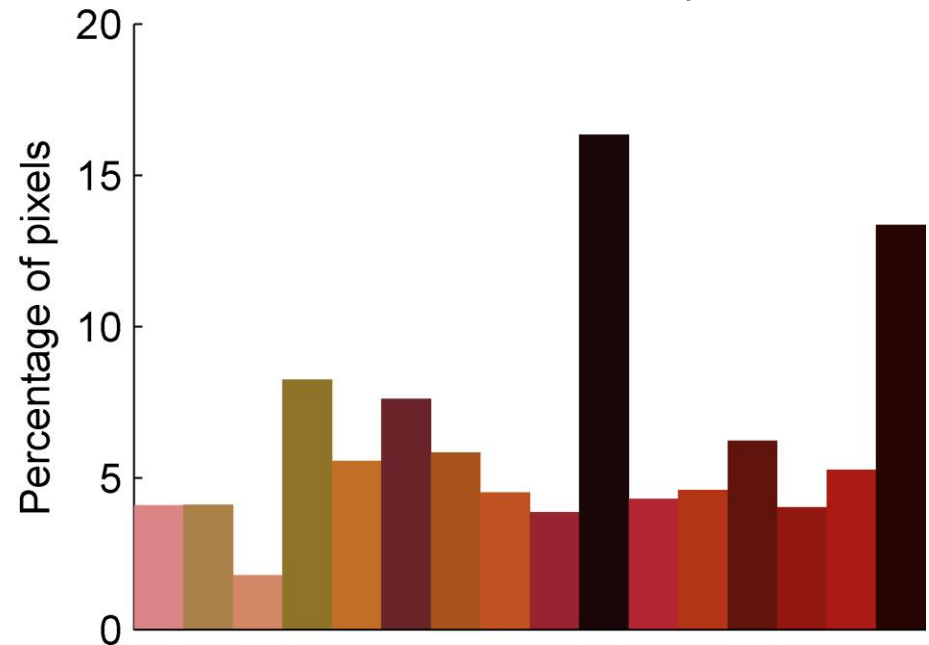

Processing

- for each photo, extract representative flower colour palette

Grevillea calliantha

Extracted flower colour palette

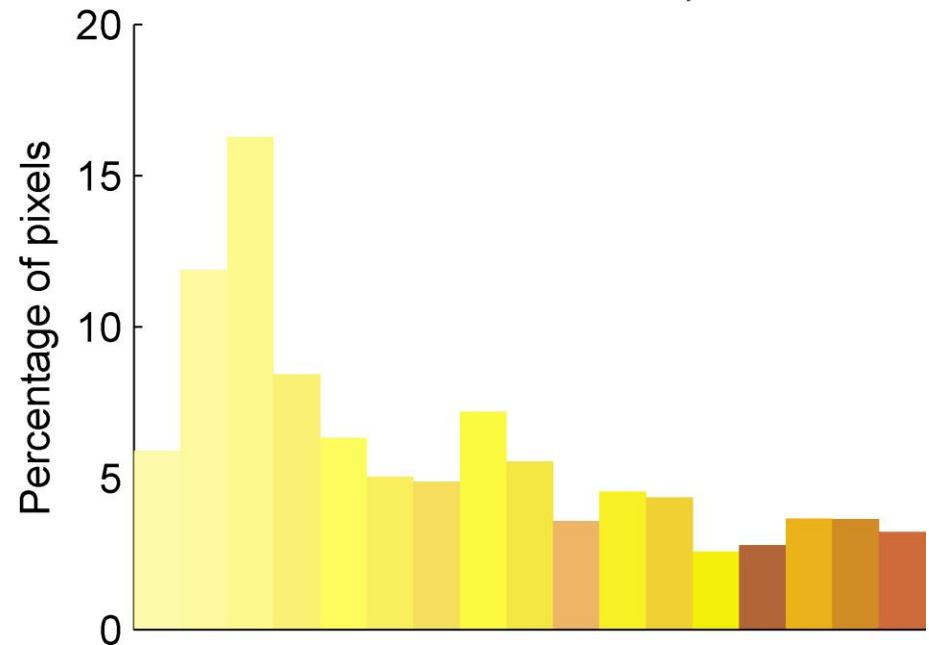

- for each photo, extract representative flower colour palette

Grevillea tenuiloba

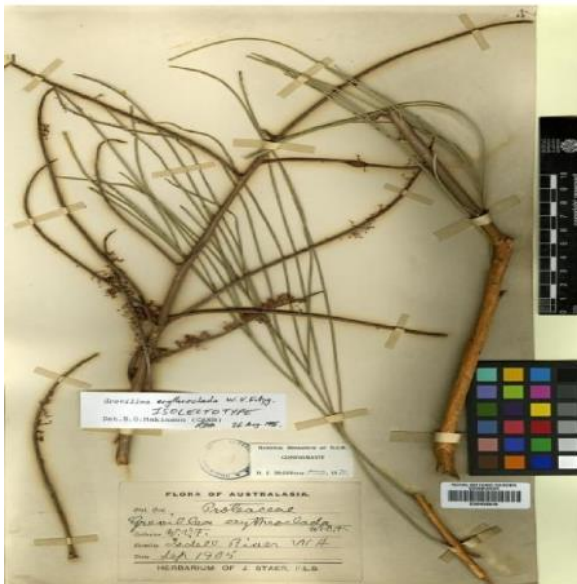

Extracted flower colour palette

Processing

- for each photo, extract representative flower colour palette

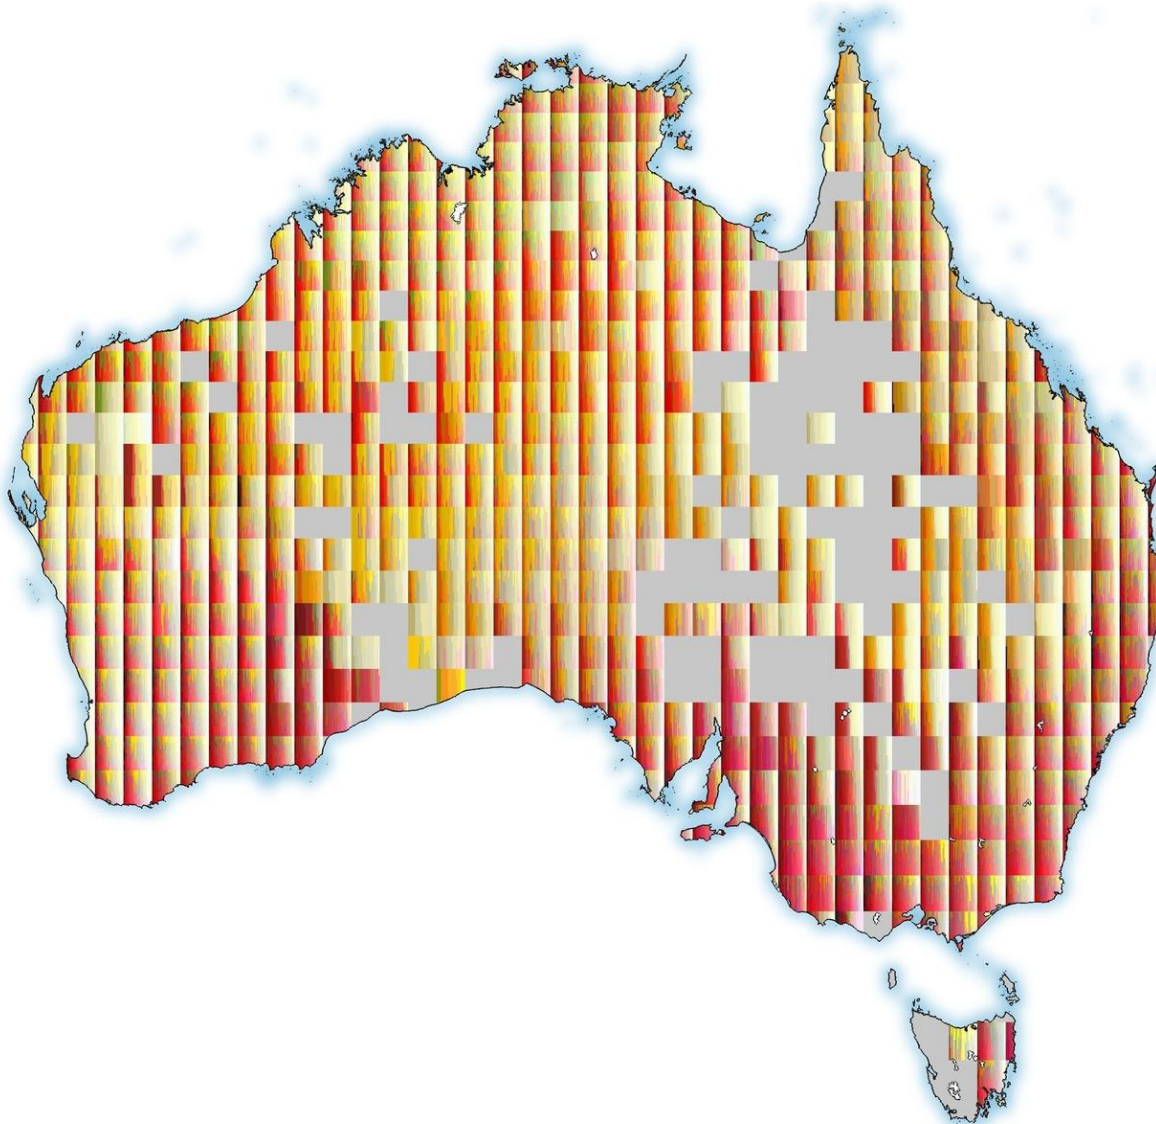

Grevillea erythroclada

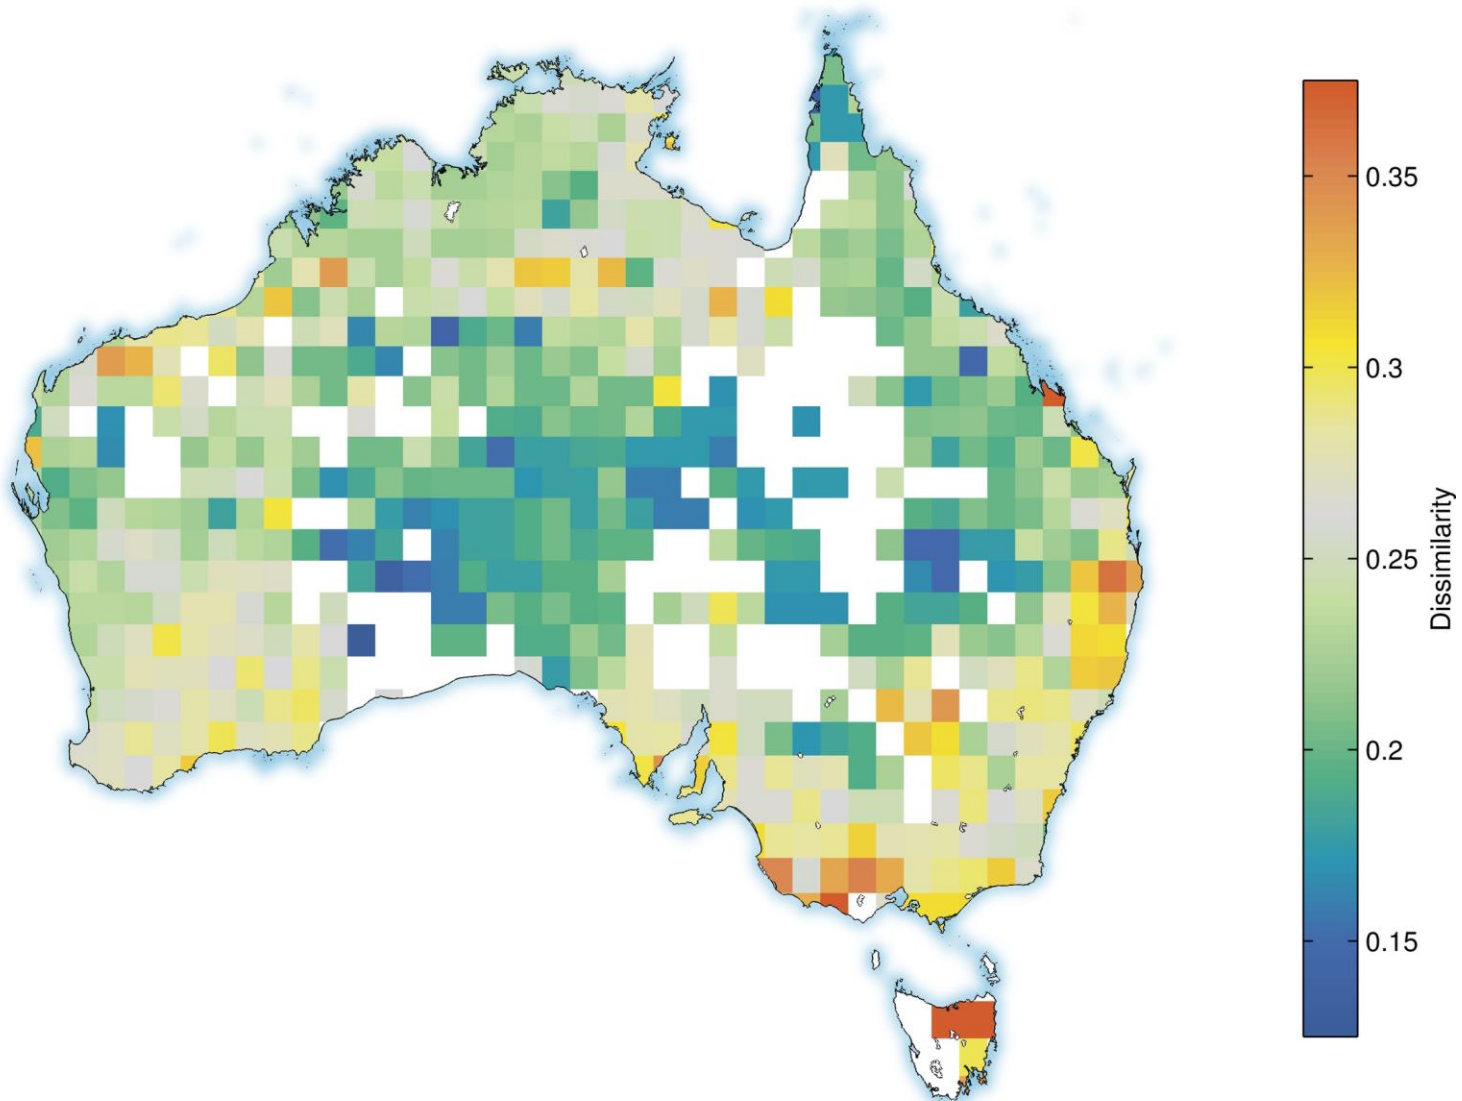

Grevillea striata

Results: Grevillea flowers

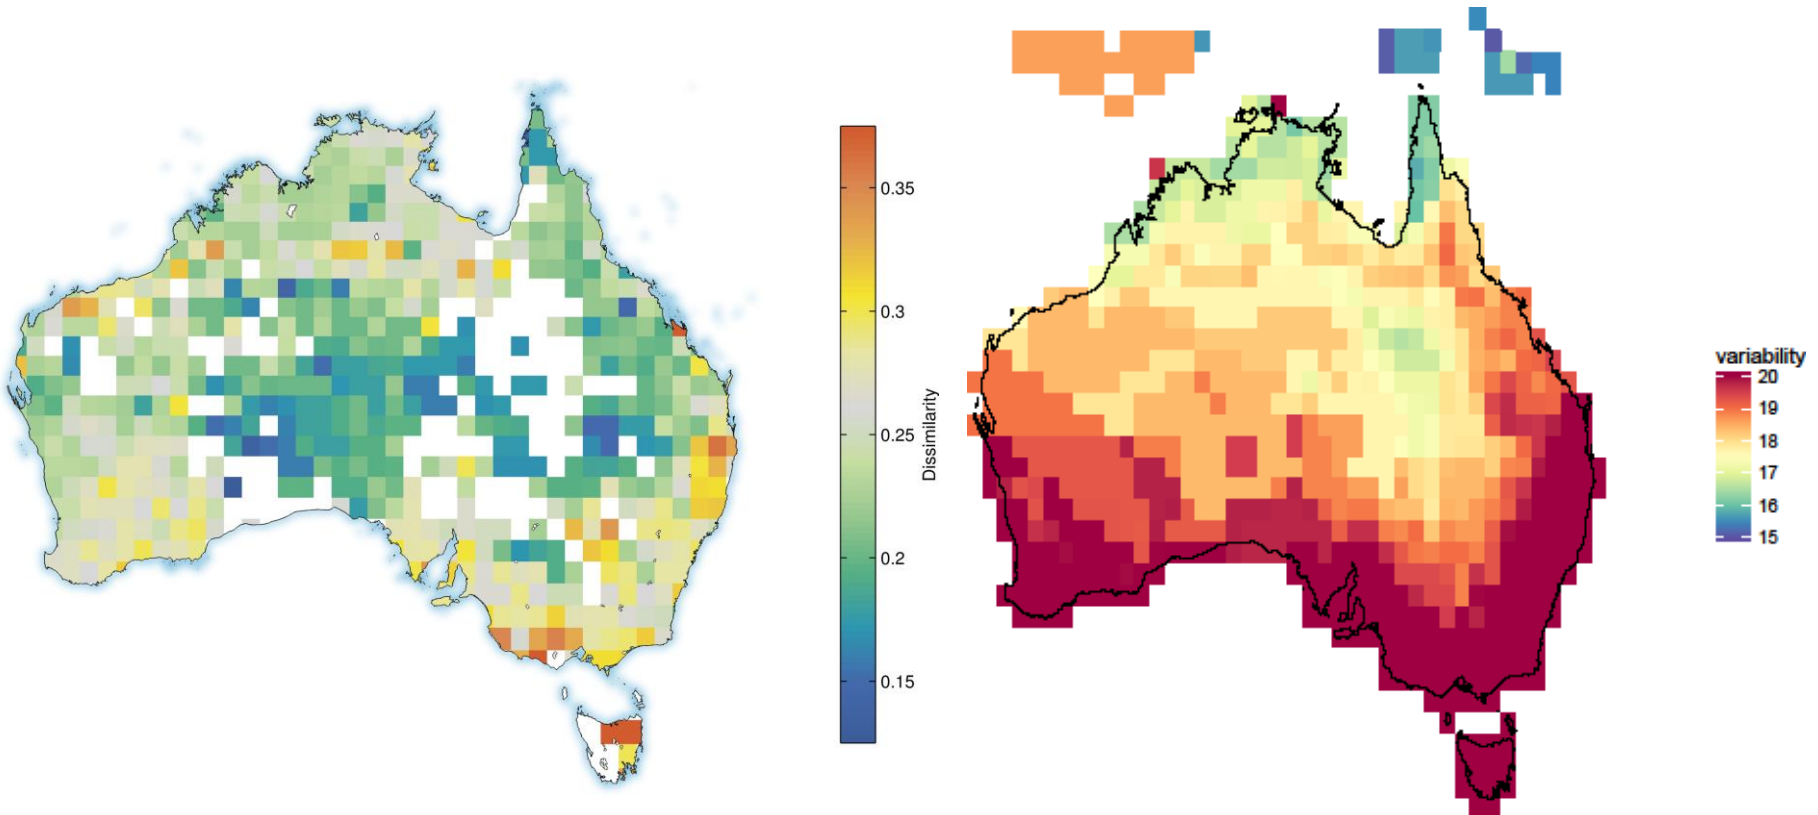

Within-species colour variability

Large-scale processes?

- within-species colour variability in *Grevillea* (left) and honeyeaters (right)

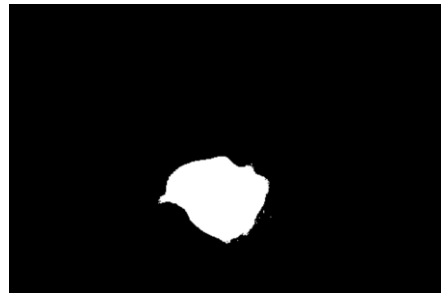

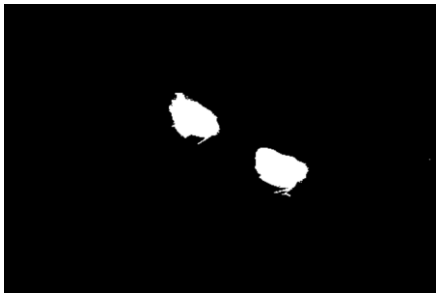

Colour processing

- manual processing of images is tedious
- deep learning methods for image processing
- open-source network for image segmentation:
<https://github.com/torrvision/crfasrnn>

Colour processing

- not fully automatic, but promising ...

And we're done!

Thanks!

alaben@untan.gl
