## [1] CRRA utility function

As a choice of utility function, CRRA (Constant Relative Risk Aversion) functions are often used in macroeconomics. The following functions are instances of CRRA functions:

$$u(c) = \begin{cases} \frac{c^{1-\theta}-1}{1-\theta} & \text{if } \theta \neq 1 \text{ and } \theta \geq 0, \\ \ln c & \text{if } \theta=1. \end{cases}$$

1. Show that the CRRA functions have constant relative risk aversion; that is constant  $-\frac{cu''(c)}{u'(c)}$ .  
More specifically,

$$-\frac{cu''(c)}{u'(c)} = \theta, \quad \text{for all } c > 0.$$

2. Show that

$$\lim_{\theta \rightarrow 1} \frac{c^{1-\theta} - 1}{1 - \theta} = \ln c.$$

## [2] Cake eating problem

You have  $w(0)$  kilogram of cake at time  $t = 0$ . The amount of cake at  $t$ ,  $w(t)$ , follows the differential equation

$$\dot{w}(t) = -c(t),$$

where  $c(t)$  [kg/min] is the instantaneous speed of consumption at time  $t$ . Find a consumption stream  $c(t)$  that maximizes your utility,

$$U = \int_0^{\infty} e^{-\rho t} \ln c(t) dt,$$

where  $\rho > 0$  is a constant discount rate.

3. Set up the Hamiltonian for the problem.
4. Derive the differential equation that  $c$  obeys.
5. Use  $w(0) = \int_0^{\infty} c(t) dt$ , which states that you are going to eat up the whole cake, to determine  $c(t)$ .
